INTRODUCTION

OVERVIEW

This project aims to develop a content-based recommender system for Leroy Merlin products.

PURPOSE

Improve the online shopping experience by suggesting similar products based on their characteristics

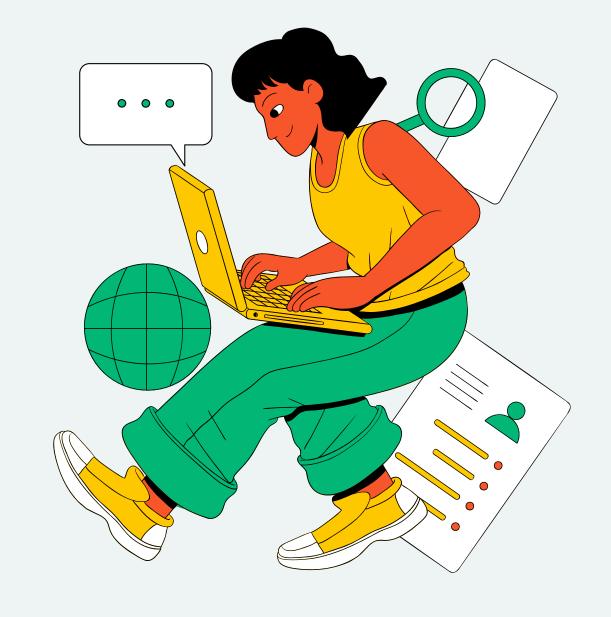

LEVERAGE

Leverage machine learning to transform raw product data into meaningful recommendations.

PROJECT OVERVIEW

Combine data preprocessing, feature engineering, and machine learning (kNN with cosine similarity) to generate recommendations.

The project uses a large product database with attributes such as dimensions, category, product description, and sales ranking.

The objetive is to build a system that, given a product reference, returns 5 similar products.

WHAT ABOUT THE DATA?

Dataset with +300.000 different products

Key Attributes:

- LM Internal Reference: Product identifier
- Section & Type: Product categories
- Dimensions & Weight
- Designación Administrativa: Product description
- Letra de Gama: Sales probability ranking

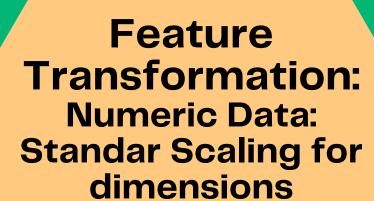

DATA PREPROCESSING & FEATURE ENGINEERING

One hot encoding

Data Filtering: Exclude 48 & 49 and empty rows

Imputation: Fill missing values in categorical values(placeholders)

Feature

Transformation:

Categorical Data:

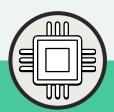

Feature Transformation: Convert description to embeddings using Sentence Transformer.

Feature Transformation: Ranking: Encode 'Letra de Gama' with One-Hot **Encoding.**

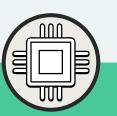

ML KEY CONCEPTS USED

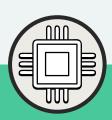

CONTENT-BASED FILTERING

Recommending items based on their features.

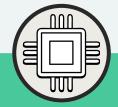

FEATURE ENGINEERING

Transforming raw data into numerical representations.

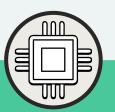

SIMILARITY MEASURES

Using cosine similarity to compare product vectors.

K-NEAREST NEIGHBORS (KNN)

Identifying the 5 most similar products to a given product.

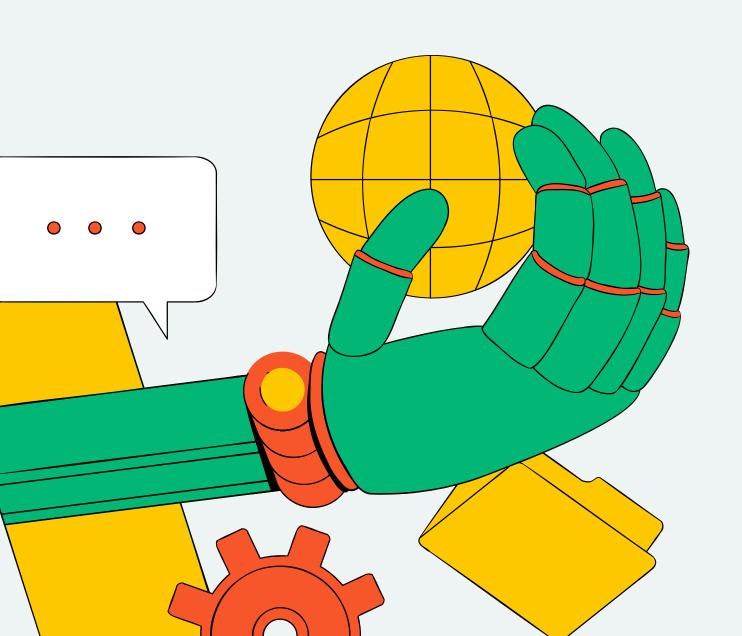

EMBEDDING TECHNIQUES

Applying sentence embeddings to capture semantic information from text

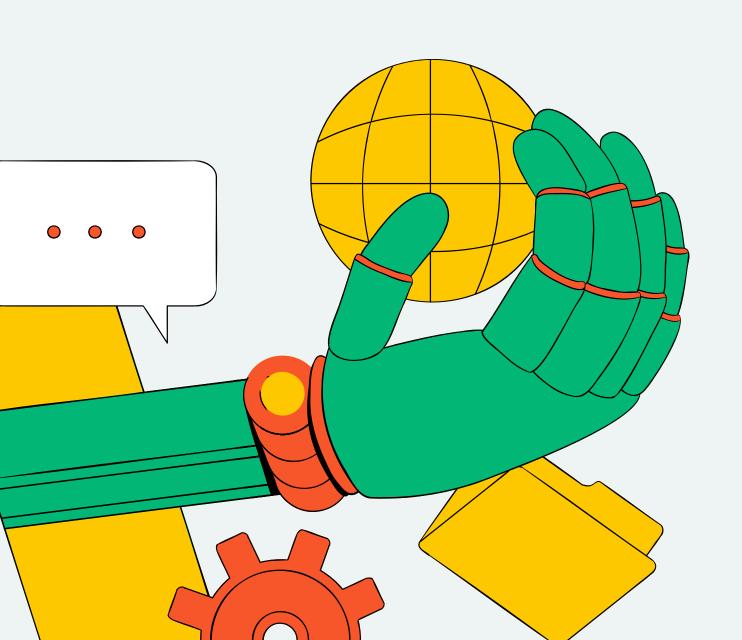

MODEL BUILDING

- A k-Nearest Neighbors model is trained using cosine similarity to measure the closeness between product vectors.
- The model combines multiple features (categorical, numerical, textual, and ranking) into a single vector per product.

WEB INTERFACE

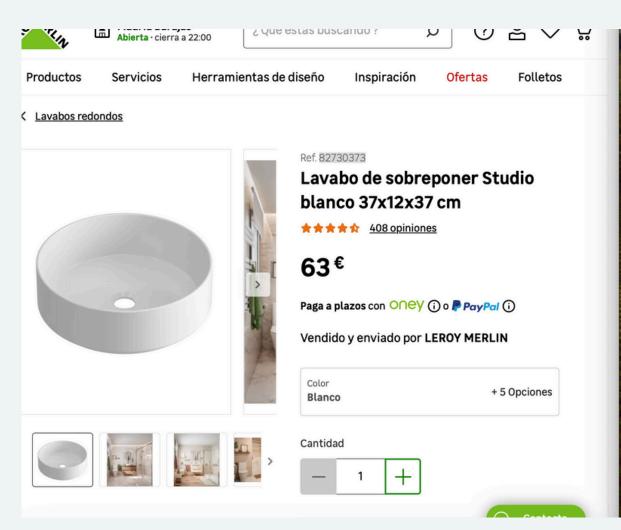

- A Flask application provides a simple web interface.
- Users enter a product reference, and the system displays 5 recommended products along with key details (LM Internal Reference, Section, Designation).
- This interface demonstrates the practical deployment of the recommendation model

RESULTS

Product Recommender

Enter product reference: Get Recommendations
